

EVIZON

(From Chaos to Clarity)

**“AI-powered Event Photo Tagging &
Archival System”**

The Hidden Chaos in University Event Photos

- Hundreds of photos per event
 - Stored randomly across drives
 - Manual sorting takes hours
 - Documentation becomes painful
 - No centralized, searchable event archive
- 

Why This Is a Serious Problem

- 1 event → 200–400 photos
 - 10–12 hours of manual effort
 - High chance of data loss
 - Affects NAAC, website, media teams
 - Repeats every semester across all departments
- 
- A solid green horizontal bar spanning the width of the slide, located at the bottom.

Meet Evizon!

An AI system that automatically understands, tags, cleans, and organizes university event photos.

Key Capabilities

- Event type detection
- Banner & poster text reading (OCR)
- Object & scene tagging
- Face clustering (privacy-safe)
- Blur & duplicate removal
- Event-wise album creation

Cleaning

Creation

How Evizon Works ?

Workflow of **Evizon** :

1. Upload event photos
 2. Vision AI + OCR analysis
 3. Tagging, clustering & filtering
 4. Structured event albums generated
 5. Download & archive
- 

Why Evizon Stands Out!

- ❑ Built specifically for university documentation
 - ❑ Not a generic photo organizer
 - ❑ Privacy-safe face clustering
 - ❑ End-to-end automation
 - ❑ Scalable across institutions
- 
- A solid green horizontal bar spanning the width of the slide, located at the bottom.

Tech Behind Evizon

AI / Vision Models

YOLOv8
MediaPipe
OpenCV

Text & Image Processing

Tesseract OCR
EasyOCR

Backend & Logic

Python
FastAPI

Frontend & Storage

React
Supabase / Firebase

Thank You

“Evizon transforms university memories into structured intelligence.”

We respect your Attention for Us!
